

[p. 1]

Tuberculosis.

Tuberculosis is a curable disease. We do not inherit it from our parents. It is a germ and is so tiny that it has to be magnified three hundred times its size to be seen. The germs were discovered by Dr. Kock¹ who died one year ago.

This disease was cause by careless spiting. Any boby² who has tuberculosis shouldn't spit on the side walk for people who are passing maybe would step in it and would carry it home on the soils of the shoes and

[p. 2]

would get on the carpets or rugs and would try up this is the cause of the little germs. Any boby who has tuberculosis should carry a little paper box so as when they wanted to spit they could spit in the little box and take it home and put it in the fire.

Esther Clegg. Grade 2.
